

Using the Transformer

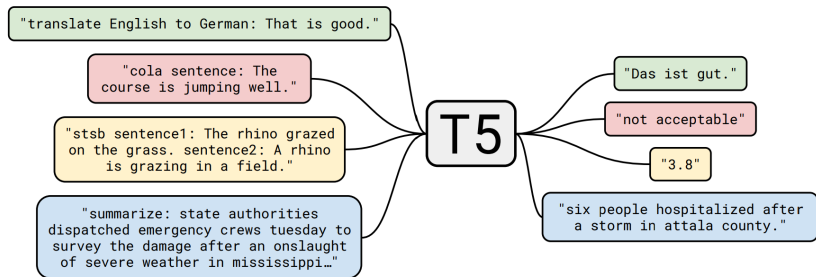

Text-to-Text Transfer Transformer

Learning goals

- shortcomings of BERT & Co.
- everything as text-to-text
- Dynamic Masking

REVISITING TEXT-TO-TEXT TASKS

► Source: Raffel et al., 2020

Ingredients:

- `<task prefix>` for each task
→ Concatenation with the input
- Output label / score formatted as string

TEXT-TO-TEXT TRANSFER TRANSFORMER

Short summary:

- In short: T5 (bc of the five Ts)
- A complete encoder-decoder Transformer architecture
- **Question:** Why is this important?
- Relative positional embeddings
- All tasks reformulated as text-to-text tasks
 - Probably the most important innovation of this work
- From BERT-size $\times 2$ (since enc-dec) up to 11B parameters
- Paradigm shift from *Sequential Transfer Learning* towards true *Multi-Task Learning*

► Nice Animation (similar to figure before)

INPUT AND OUTPUT FORMAT

Input Side:

- SentencePiece framework w/ WordPiece tokens
 - Add task-specific (text) prefix to the original input
 - Choice of the prefix: Hyperparameter!!
- Changing this had limited impact
- No extensive experiments performed by the authors

Output Side:

- Output as a word or a piece of text (also numerical similarity scores)
- If output not present in set of potential alternatives, prediction considered as wrong (many other possible ways; this is not trivial)

TASK PREFIX VS. PROMPTING

Adding task-specific (text) prefix:

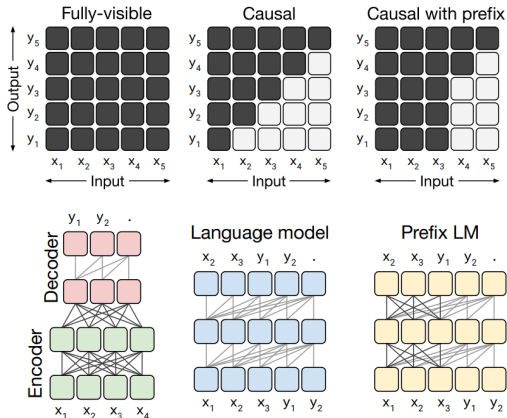

- Add task-specific (text) prefix to the original input
 - Model is fine-tuned on samples prepended with this prefix
- It learns to recognize what it is expected to do when encountering a specific prefix at test time
- Probably because of this: limited impact found by the authors

Prompting:

- Refers to just querying a trained w/o fine-tuning it (cf. next chapter)
- Paradigm of Few-/Zero-Shot Learning
- This is found to have a *huge* impact on model performance

ARCHITECTURAL DIFFERENCES

Attention patterns (top) and Schematics of considered architectures (bottom)

PRE-TRAINING OBJECTIVE

Original text

Thank you ~~for inviting~~ me to your party ~~last~~ week.

Inputs

Thank you <X> me to your party <Y> week.

Targets

<X> for inviting <Y> last <Z>

► Source: Raffel et al., 2020

- 1 Mark spans in input sequence for corruptions
- 2 Replace tokens with sentinel tokens
- 3 Predict sentinel tokens and replaced tokens

PRE-TRAINING OBJECTIVES

- Authors experimented with different objectives
- Most of them rely in some way on MLM

Objective	Inputs	Targets
Prefix language modeling	Thank you for inviting	me to your party last week .
BERT-style Devlin et al. (2018)	Thank you <M> <M> me to your party apple week .	<i>(original text)</i>
Deshuffling	party me for your to . last fun you inviting week Thank	<i>(original text)</i>
MASS-style Song et al. (2019)	Thank you <M> <M> me to your party <M> week .	<i>(original text)</i>
I.i.d. noise, replace spans	Thank you <X> me to your party <Y> week .	<X> for inviting <Y> last <Z>
I.i.d. noise, drop tokens	Thank you me to your party week .	for inviting last
Random spans	Thank you <X> to <Y> week .	<X> for inviting me <Y> your party last <Z>

PRE-TRAINING OBJECTIVES

► Source: Raffel et al., 2020

THE COLOSSAL CLEAN CRAWLED CORPUS (C4)

- Effort to measure the effect of quality, characteristics & size of the pre-training resources
- Common Crawl as basis, careful cleaning and filtering for English language
- Orders of magnitude larger (750GB) compared to commonly used corpora

T5 - EXHAUSTIVE EXPERIMENTS

Performed experiments with respect to ..

- .. *architecture, size & objective*
 - enc, dec, enc-dec
 - Between 60M and 11B parameters
- .. *details of the Denoising objective (which was found to work best)*
- .. *fine-tuning methods*
 - Adapter layers
 - Gradual Unfreezing (cf. ULMFiT)
- .. *Multi-task learning strategies*
 - Examples-proportional mixing
 - Temperature-scaled mixing

T5 - EXHAUSTIVE EXPERIMENTS

Conclusions

- Encoder-decoder architecture works best in this "text-to-text" setting
- More data, larger models & ensembling all boost the performance
 - Larger models trained for fewer steps better than smaller models on more data
 - Ensembling: Using same base pre-trained models worse than complete separate model ensembles
- Different denoising objectives work similarly well
- Updating *all* model parameters during fine-tuning works best (but expensive)
